SCOPE

The **Journal of Nuclear Materials** publishes high quality papers in materials research relevant to nuclear fission and fusion reactor technologies, and in closely related aspects of materials science and engineering. Both original research and critical review papers covering experimental, theoretical, and computational aspects of either fundamental or applied nature are welcome. The breadth of the field is such that a wide range of processes and properties is of interest to the readership, spanning atomic lattice defects, microstructures, thermodynamics, corrosion, and mechanical and physical properties, for example. The following list, which is not exhaustive, describes topics appropriate to the Journal.

- Fission reactor materials, including fuels, cladding, core structures, pressure vessels, moderator and control components; fission product behavior.
- Materials aspects of the fabrication and reprocessing of fuels.
- Performance of nuclear waste materials, glasses and ceramics, immobilization of wastes.
- Fusion reactor materials, including first walls, blankets, insulators, and magnets.
- Neutron radiation effects in materials, including defects, microstructures, transmutations, phase changes, and macroscopic properties.
- Interactions of plasmas, ion beams, electron beams and electromagnetic radiation with materials.

INSTRUCTIONS TO CONTRIBUTORS

Contributions may be written in English, French or German, and should be submitted *in duplicate* to one of the Editors, either directly or through a member of the Advisory Editorial Board.
The Editors may at their discretion submit contributions to referees. The submission of a contribution will be taken to imply that the author has satisfied himself that no copyright will thereby be infringed.
Submission of a paper to any of the Editors will be taken to imply that permission to publish has been given by the appropriate authorities. Neither the Editors nor the Publisher can accept any responsibility in this respect.

Abstracts should be written in English. The abstract should be on a separate sheet (complete with the title and names of the authors).
Abstracts should not exceed a total length of 150 words. Longer abstracts will be shortened by the Editors if necessary, without consulting the authors.

Manuscripts should be typewritten on one side of the paper only, with double spacings and wide margins. Only first copies and clear xerographic prints thereof are acceptable to the printers.

Headings and subheadings should be typed in lower case except for the initial capital letter.

Displayed formulae should be numbered and typed or *clearly* written by hand. Vectors will be printed in ***boldface italics*** (heavy, slanting type), and should be indicated by a wavy underlining in the typescript.
Otherwise no symbols should be underlined. Special attention should be paid to the clear distinction of characters which can easily be misread such as i (lower case), I (cap.), l (el), 1 (one), ′ (prime); o (lower case), O (cap.), 0 (zero); u, v (lower case), ν (greek nu), V (cap.); s, S; x, X, $\times$; p, P, ρ (Greek rho); etc. If necessary, unusual symbols should be explained in pencil in the margin.

Units and symbols: the use of metric units in the SI (Système Internationale) form is *obligatory*. Potential contributors are referred to complete and modern descriptions such as: (1) ASTM E-380-93, Standard Practice for Use of the International System of Units (SI) (The Modernized Metric System) published by The American Society for Testing and Materials, Philadelphia, PA, 1993 – updated annually; (2) Quantities, Units and Symbols in Physical Chemistry, edited by I. Mills et al., published by Blackwell Scientific Publications, Oxford, UK, 1993 – published on behalf of the International Union of Pure and Applied Chemistry.

Tables should be typed on separate sheets, and should have a title in addition to their serial number; their desired location should be indicated in the margin of the text.

Figures: line drawings should be originals, drawn in black India ink or (preferably not) glossy prints of good quality. Computer plots are acceptable. Xerox copies are *not* acceptable. Figures should be drawn in such a way that they can be reduced to a final width of 76 mm (i.e. the column width); in exceptional cases a reduction to a width of 160 mm (two columns) will be allowed. All the lettering (numerical scales, scale and curve legends, etc.) as well as the details (e.g. graph symbols) should be such that a height of 1.5–1.8 mm results after reduction. The lettering should be done with a lettering guide (stencil) or using stripletters (Letraset, etc.). Each figure should have a number and a caption. The captions should be typed on a seperate sheet. The desired location of figures should be indicated in the margin of the text. Photographs should be unmounted, unless they form part of a composite figure, and be richer in contrast than is desired in the printed version. Only original ink drawings and photographs will be returned after publication of the paper.

Colour plates: Illustrations can be printed in colour when they are judged by the Editor to be essential to the presentation. The Publisher and the author will each bear part of the extra costs involved. Further information concerning colour illustrations and the cost to the author is available from the Publisher.

References to published literature should be quoted in the text by the name of the author followed by a number in square brackets in the sequence of citation. The references should be listed at the end of the typescript as in the following examples: [1] for a paper in a journal, [2] for a book, [3] for a paper in a Conference Proceeding, [4] for a paper in a contributed volume, [5] for a report of a laboratory:

Footnotes should be avoided as far as possible.

Rapid publication: short manuscripts (not exceeding a total length of 2000 words) which have been entitled: "Letter to the Editors" by the author(s) will be published directly, without sending proofs to the author(s). Abstracts may be included with Letters, however, their length should be limited to 75 words.

Corrections in the proofs should be limited to printer's errors; owing to the time-consuming and expensive work involved, any other changes in the proofs may be charged to the authors. They should therefore check their manuscript carefully for typographical errors and small inconsistencies. The submitted paper should be in final form.
Alterations in abstracts are not acceptable at proof stage and will be ignored unless approved by one of the Editors.

Page charge and reprints: there will be no page charge. Reprints may be ordered from the publisher. An order form will be sent to contributors together with the proofs. 50 reprints of each article will be supplied free of charge.

Books for review should be offered or sent to one of the Editors.

News or announcements should be submitted in duplicate to one of the Editors.

Upon acceptance of an article the author(s) will be asked to transfer copyright of the article to the publisher. This transfer will ensure the widest possible dissemination of information.

Handbook on Semiconductors, Volume 2

Optical Properties of Semiconductors

Edited by **M. Balkanski**

©1994 872 pages Price: Dfl. 525.00 (US$309.00) ISBN 0-444-89101-3

This completely revised volume reflects the revolutionary changes that have taken place in the field of semiconductor physics and technology in the last twenty years. It provides an introduction and background to the many fascinating properties and applications of quantified semiconductor structures. Papers on surface properties, which are of great importance, occupy half of the volume, as a necessary preamble to the quantified semiconductors structure. The volume opens with a discussion on different aspects of the optical properties of semiconductor surfaces that are related to the creation and annihilation of elementary excitations such as phonons, magnons, plasmons and excitons. Further chapters deal with subjects such as photoemission, infrared spectroscopy, intraband optical properties of low-dimensional semiconductor systems and modulation spectroscopy of semiconductors and semiconductor micro-structures.
